

PROJECT PLAN · SIMPLE VERSION · V2 (MATCHED TO THE CODE)

Wonder Herb Admin Rebuild

康草堂 · 網站後台重建計劃

Give the client a Wix-like editor to run their own website, on our own stack, with full control and no monthly Wix fee.

This version is updated after reading the actual project. Good news: much of the hard plumbing already exists. The real work left is smaller and clearer than it first looked.

Updated 8 September 2026 · based on the current repo

01 What we have now

More is built than the first plan assumed. The editing and publishing plumbing already works. One important gap remains.

The edit-to-publish loop already works. The weak point is that content is drawn by the browser, not baked into the page.

Already built (this is the head start)

- ✓ Express + MongoDB API: products, stock, sales, invoices, roles, and a test suite.
- ✓ Publish pipeline: export the database, commit, GitHub Pages deploys automatically.
- ✓ Content already lives as data (products, cases, FAQ, homepage).
- ✓ Pages CMS pilot gives a form editor, git-based, with all 7 languages.
- ✓ 7 languages set up: Chinese main, plus EN, DE, ES, FR, JA, RU falling back to Chinese.

Still missing

- ✗ No Wix-like visual editor. Editing is forms and a database, not click-on-the-page.
- ✗ The 18 page layouts are still hand-coded. You cannot add or reorder sections.
- ✗ Content is loaded in the browser, so crawlers see little. This hurts the SEO/GEO work.
- ✗ The API and database are not hosted yet. They run on the laptop.
- ✗ 72 MB of 3D models sit inside the repo and redeploy on every push.

What we will build

Keep everything that works. Add the two things that are missing: pages that pre-render, and a Wix-like visual editor.

Change 1 — pre-render the pages

Today the browser builds the content. We change the publish step so it writes the content **into** the HTML. Same data, same pipeline, but now Google and AI crawlers see the real page. This protects the SEO/ GEO work and is the single most valuable change.

Change 2 — a Wix-like editor

Add **Puck**, a ready-made open editor (MIT, self-hosted, our data). The client clicks on the real page, edits it, adds and reorders sections, and publishes. Forms and the database stay for the business side; Puck is for building pages.

The architecture

Green is already built. Gold is what we add. Nothing green gets thrown away.

The editor and the database stay. We add pre-rendering (so content is crawlable) and move heavy files out of the repo.

Two editors, on purpose. Forms are faster for lists like products and cases. The visual canvas is better for building page layouts. We keep both and draw a clear line: **Pages CMS / admin for content, Puck for pages.**

03 How it works

Two simple ideas: a page layout becomes data, and editing follows one safe path to going live.

1. A page layout becomes data

Content is already data. This step turns the page layout into data too, so it can be edited visually and pre-rendered.

2. From edit to live, one safe path

The publish path already exists. Git history gives version control and rollback for free.

Why sections, not free dragging. Wix's "drag anything anywhere" is the top cause of broken Wix sites, especially on phones. The client gets add / move / duplicate / edit and a choice of 2 to 3 layouts. They cannot nudge things and break the phone view.

What the result will be like

The client keeps the Wix feeling and gains full ownership, and the site gets more crawlable, not less.

BEFORE (today)

- Editing means forms and a database
- Page layouts need a developer
- Content is hidden from crawlers
- API runs only on the laptop

AFTER (this project)

- Client edits on the real page, like Wix
- Add and reorder sections, no developer
- Content baked in, better for SEO/GEO
- Hosted, full control, no lock-in

For the client, day to day

- ✓ Change a headline, swap a photo, add a section, add a product, publish.
- ✓ Works in all 7 languages, with a clear "what is missing" view.
- ✓ Same words and layout Wix uses, so it feels familiar.
- ✓ Break something? Git history puts it back.

For the business

- Content becomes visible to Google and AI crawlers, so the SEO/GEO work finally lands.
- No monthly Wix fee. Running cost is small.
- We own the code and the data. Nothing is locked to Wix.
- A broken admin can never take the live site down.

What it costs to run (US\$, how these services bill)

Static hosting

\$0

GitHub Pages, already in use

API host

\$0 to \$12

Vercel free tier, or a small VPS

Database

\$0 to \$9

MongoDB Atlas free tier to start

Media + CDN (R2)

\$1 to \$3

images, video, the 72MB of 3D

Backups + email

~\$1

nightly backup, password resets

Total

~\$5 to \$25/mo

Wix Business is ~\$30 to \$50/mo

Prices in HKD are roughly 8× these figures. Two things matter more than the bill: someone must own the host (a couple of hours a month, or use managed services), and publishing needs its safety net, which Git already provides.

05 What editing will feel like

A mockup of the admin. The client sees their real page in the middle and edits it directly, the way Wix works.

Mockup, not a live screenshot. Left: add blocks. Middle: the real page, click to edit. Right: settings for the block you picked.

Familiar on purpose

- ✓ Add panel on the left, settings on the right, Preview and Publish top right, same as Wix.
- ✓ Click a heading and type. Pick a photo and it swaps.

Safe by design

- Move, duplicate or delete a block with the small toolbar. No pixel dragging to break the phone view.
- Every text box has a language, so all 7 languages live in one place.

06 What visitors will see

A mockup of a published product page. Same look as today, but now the content is baked in, so Google and AI crawlers read it.

Mockup, not a live screenshot. Desktop and phone from one source, so nothing breaks on mobile. Prices shown in HKD.

The quiet win. Because the content is now written into the page, a search engine or an AI assistant reading wonder-herb.com sees the real product names, prices and text, not an empty shell. That is what makes the SEO/GEO work pay off.

07 The plan: two stages

Ship a usable slice first, with Wix still live, then complete everything and switch over. Timeline is yours to set.

STAGE 1 — a usable slice

Wix still live · client edits and pre-renders the main pages on the new tool

Host API + DB, move media

Renderer (pre-render)

Puck + core sections

Migrate core pages (ZH)

Demo

STAGE 2 — full switch

all pages, all 7 languages · forms + dashboard rounded out · then cut over and cancel Wix

All 22 sections + 18 pages

All 7 languages

Forms + dashboard parity

Security + staging

Cut over

Because the pipeline already exists, Stage 1 goes straight to pre-rendering and the visual editor.

What gets done	Already built	Stage 1	Stage 2
API (auth, products, stock, sales)	✓ done	Host it	Yes
Publish pipeline (export → commit → deploy)	✓ done	Yes	Yes
7-language data model	✓ done	Yes	Yes
Content as data (products, cases, FAQ)	✓ done	Yes	Yes
Pre-render pages (content baked in for SEO)	—	Core pages	All pages
Move media + 72MB 3D out of the repo	—	Yes	Yes
Puck visual editor: click, add, reorder	—	Yes	Yes
Section components	—	8 to 10 core	Full ~22
Page layouts migrated to data	—	Core 4 to 5	All 18
Languages migrated	—	Chinese first	All 7
Permissions (lock page delete / SEO)	partial	Yes	Yes
Add new page from a template	—	Later	Yes
Forms (visitor submissions to dashboard)	—	Later	Yes
Dashboard parity (contacts, orders, analytics)	partial	Later	Yes
Security hardening + staging	—	Minimal	Yes
Switch off Wix	—	Keep as backup	Yes

Stage 1 leans on Pages CMS for content editing while the Puck editor is built, so the client has something to use early.

Risks, and what we do about them

- **Content hidden from crawlers.** Pre-rendering fixes it. Each page passes an SEO check (schema, hreflang, canonical, meta) before it goes live.
- **Two editors confuse people.** Draw a clear line: forms for content, Puck for page layouts.
- **72MB in the repo.** Move 3D and media to R2/CDN so deploys stay small and fast.
- **Split hosting.** The site is on GitHub Pages, the admin/API on Vercel. Pick one story and document it.
- **Client publishes something broken.** Preview, Git history, one-click rollback, backups.

Decisions we need before we start

- Confirm the pre-render change is in scope. It is the key SEO decision.
- Confirm the two-editor split (Pages CMS for content, Puck for pages).
- Where the API and database are hosted: Vercel + Atlas, or a small VPS.
- How much can the client change: delete a page, edit SEO, or admin-only?
- Does the shop need real online orders and payment, or stay staff-entered?

The honest headline. A full, all-pages, all-languages switch is a bigger job than the first usable slice. The smart order holds whatever the timeline: ship the slice first, pre-rendered pages that fix the SEO gap plus a working Wix-like editor on the main pages, with Wix still live underneath, then complete the rest and cut over.

In one sentence

Most of the right foundation is already built, so we add two things: pre-render the pages so content is crawlable, and put a ready-made visual editor (Puck) on top, giving the client the Wix experience with full control, lower cost, and no lock-in.
